

## General Description

The MAX14690 is a battery-charge-management solution ideal for low-power wearable applications. The device includes a linear battery charger with a smart power selector and several power-optimized peripherals. The MAX14690 features two ultra-low-power buck regulators with a typical quiescent current of 900nA. In addition, three ultra-low power low-dropout (LDO) linear regulators, with a typical quiescent current of 600nA are included. In total, the MAX14690 can provide up to five regulated voltages, each with an ultra-low quiescent current, critical to battery life for the unique power profile in 24/7 operation devices, such as those in the wearable market.

The battery charger features a smart power selector that allows operation on a dead battery when connected to a power source. To avoid overloading a power adapter, the input current to the smart power selector is limited based on an I<sup>2</sup>C register setting. If the charger power source is unable to supply the entire system load, the smart power control circuit supplements the system load with current from the battery.

The two synchronous, high-efficiency step-down buck regulators feature a fixed-frequency PWM mode for tighter regulation and a burst mode for increased efficiency during light-load operation. The output voltage of these regulators can be programmed through I<sup>2</sup>C with the default preconfigured.

The three configurable LDOs each have a dedicated input pin. Each LDO regulator output voltage can be programmed through I<sup>2</sup>C with the default preconfigured. The linear regulators can also be configured to operate as power switches that may be used to disconnect the quiescent load of the system peripherals.

The MAX14690 features a programmable power controller that allows the device to be configured for applications that require the device be in a true-off, or always-on, state. The controller also provides a delayed reset signal and voltage sequencing.

The MAX14690 is available in a 36-bump, 0.4mm pitch, 2.72mm x 2.47mm wafer-level package (WLP).

**Ordering Information** appears at end of data sheet.

## Benefits and Features

- Extend System Use Time Between Battery Charging
  - Dual Ultra-Low-I<sub>Q</sub> 200mA Buck Regulators
    - Output Programmable from 0.8V to 1.8V and 1.5V to 3.3V
    - 0.9μA (typ) Quiescent Current
    - Automatic Burst or Forced-PWM Modes
  - Three Ultra-Low-I<sub>Q</sub> 100mA LDOs
    - Output Programmable from 0.8V to 3.6V
    - 0.6μA (typ) Quiescent Current
    - 2.7V to 5.5V Input with Dedicated Pin
- Easy-to-Implement Li+ Battery Charging
  - Smart Power Selector
  - 28V/-5.5V Tolerant Input
  - Thermistor Monitor
- Minimize Solution Footprint Through High Integration
  - Provides Five Regulated Voltage Rails
  - Switch Mode Option on Each LDO
- Optimize System Control
  - Monitors Pushbutton for Ultra-Low Power Mode
  - Power-On Reset Delay and Voltage Sequencing
  - On-Chip Voltage Monitor Multiplexer

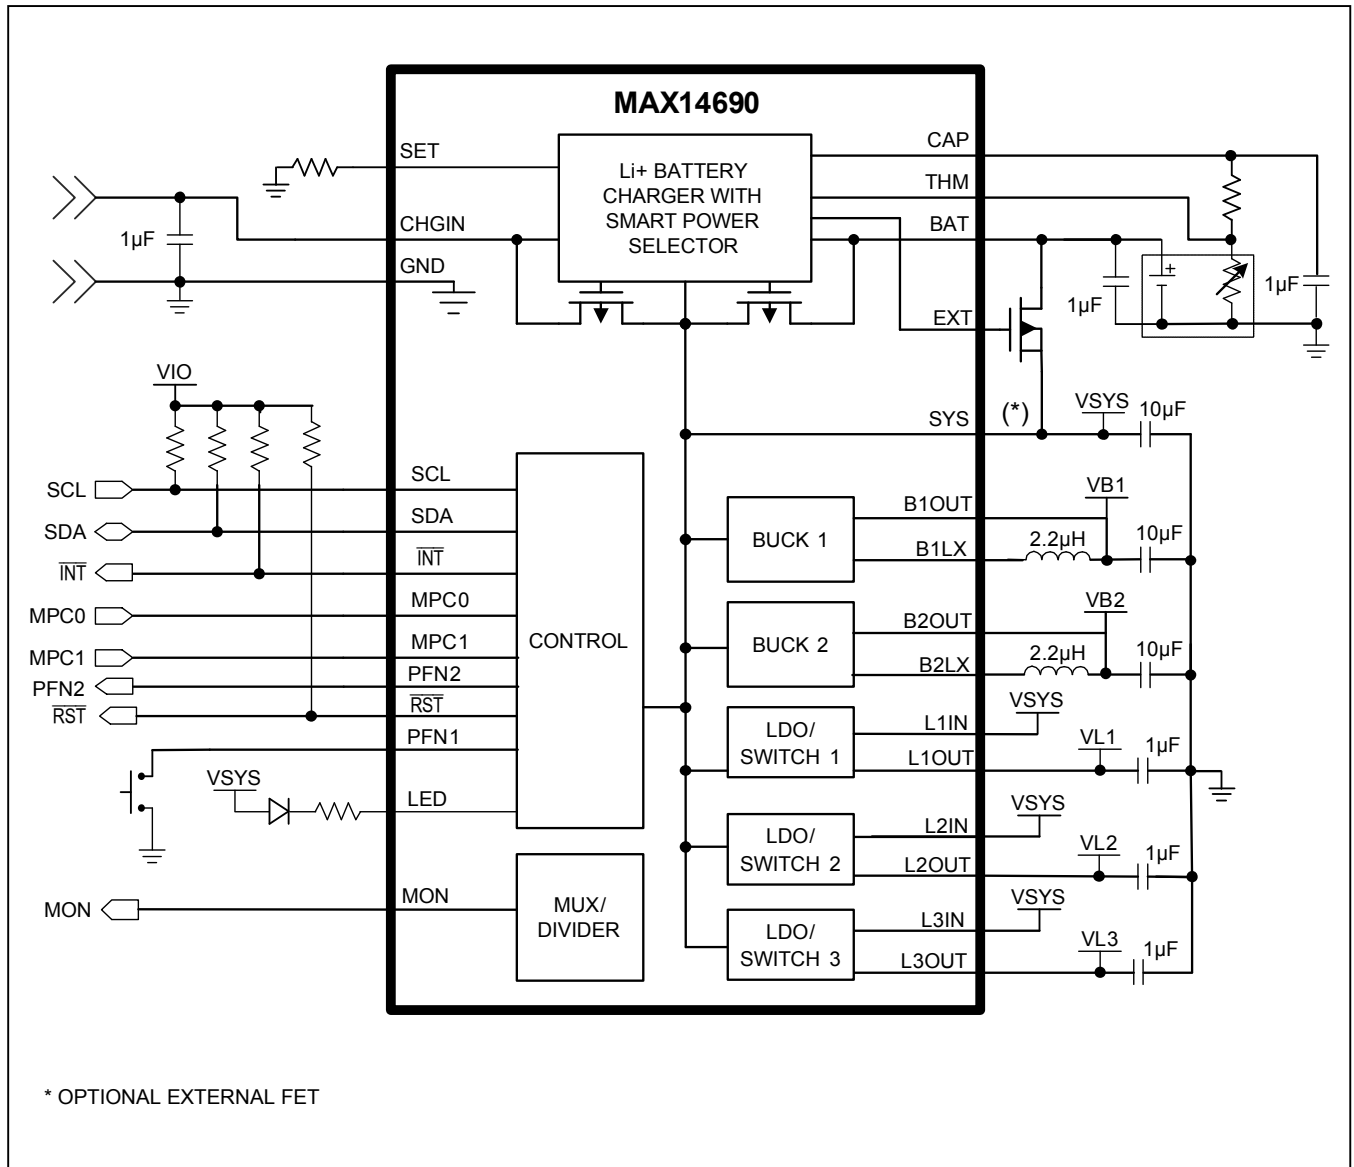

## Applications

- Wearable Electronics
- Fitness Monitors
- Portable Medical Devices

## Block Diagram

Typical Application Circuit

### Absolute Maximum Ratings

(Voltages referenced to GND.)

SDA, SCL, THM, RST, SYS, PFN1, PFN2, MPC0, MPC1, INT, MON, BAT LED, L1IN, L2IN, L3IN.....	-0.3V to +6.0V
B1LX, B2LX, B1OUT, B2OUT, EXT .....	-0.3V to (V <sub>SYS</sub> + 0.3V)
L1OUT .....	-0.3V to (V <sub>L1IN</sub> + 0.3V)
L2OUT .....	-0.3V to (V <sub>L2IN</sub> + 0.3V)
L3OUT .....	-0.3V to (V <sub>L3IN</sub> + 0.3V)
CHGIN .....	-6V to +30V
CAP .....	-0.3V to min (V <sub>CHGIN</sub> + 0.3V, +6V)
SET .....	-0.3V to V <sub>BAT</sub> + 0.3V

Continuous Current into CHGIN, BAT, SYS .....	±1000mA
Continuous Current into any other terminal .....	±100mA
Continuous Power Dissipation (multilayer board at +70°C):	
6 x 6 Array 36-Bump 2.72mm x 2.47mm	
0.4mm Pitch WLP (derate 21.70mW/°C).....	1.74W
Operating Temperature Range.....	-40°C to +85°C
Junction Temperature.....	+150°C
Storage Temperature Range .....	-65°C to +150°C
Lead Temperature Soldering (10s).....	+300°C
Soldering Temperature (reflow) .....	+260°C

### Package Thermal Characteristics (Note 1)

WLP

Junction-to-Ambient Thermal Resistance (θ<sub>JA</sub>) .....46°C/W

**Note 1:** Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maximintegrated.com/thermal-tutorial](http://www.maximintegrated.com/thermal-tutorial).

*Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.*

### Electrical Characteristics

(V<sub>CHGIN</sub> = 5.0V, V<sub>BAT</sub> = 3.7V, T<sub>A</sub> = -40°C to +85°C, all registers in their default state, unless otherwise noted. Typical values are at T<sub>A</sub> = +25°C.) (Note 2)

Setup Time for STOP Condition	$t_{SU:STO}$		0.6			$\mu s$
Spike Pulse Widths Suppressed by Input Filter	$t_{SP}$	(Note 9)		50		ns

**Note 2:** All devices are 100% production tested at  $T_A = +25^{\circ}C$ . Limits over the operating temperature range are guaranteed by design.

**Note 3:** For input voltages larger than 4.4V, output regulated voltage below 1V are available ONLY in burst mode.

**Note 4:** This value is included in the  $I_{BAT}$  quiescent current values for the on states.

**Note 5:** When the die temperature exceeds  $T_{CHGIN\_SHDN}$ , the CHGIN-to-SYS path, and the charger is turned off.

**Note 6:** When the die temperature exceeds  $T_{CHG\_LIM}$ , the charger current starts to decrease.

**Note 7:**  $f_{SCL}$  must meet the minimum clock low time plus the rise/fall times.

**Note 8:** The maximum  $t_{HD:DAT}$  has to be met only if the device does not stretch the low period ( $t_{LOW}$ ) of the SCL signal.

**Note 9:** Filters on SDA and SCL suppress noise spikes at the input buffers and delay the sampling instant.

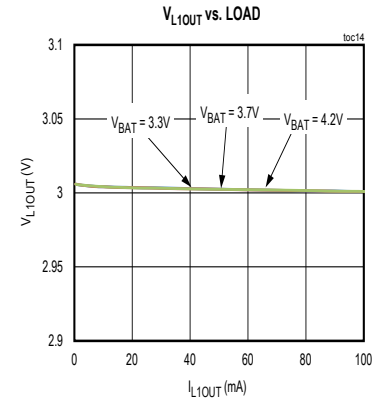

Typical Operating Characteristics

( $V_{BAT} = 3.7V$ ,  $V_{CHGIN} = 0V$ , registers in their default state,  $T_A = +25^\circ C$ , unless otherwise noted.)

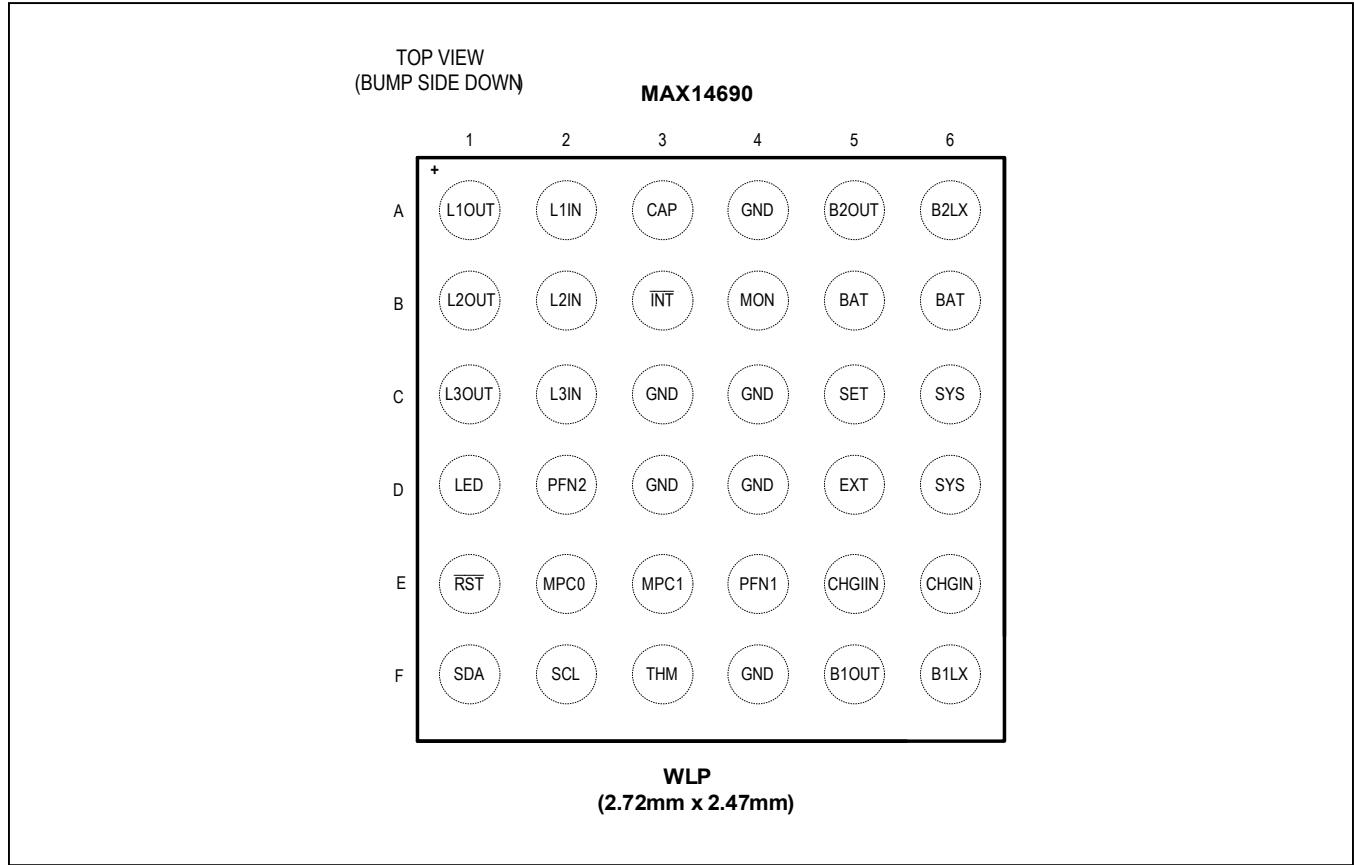

Typical Operating Characteristics (continued)

( $V_{BAT} = 3.7V$ ,  $V_{CHGIN} = 0V$ , registers in their default state,  $T_A = +25^\circ C$ , unless otherwise noted.)

Pin Configuration

Bump Description

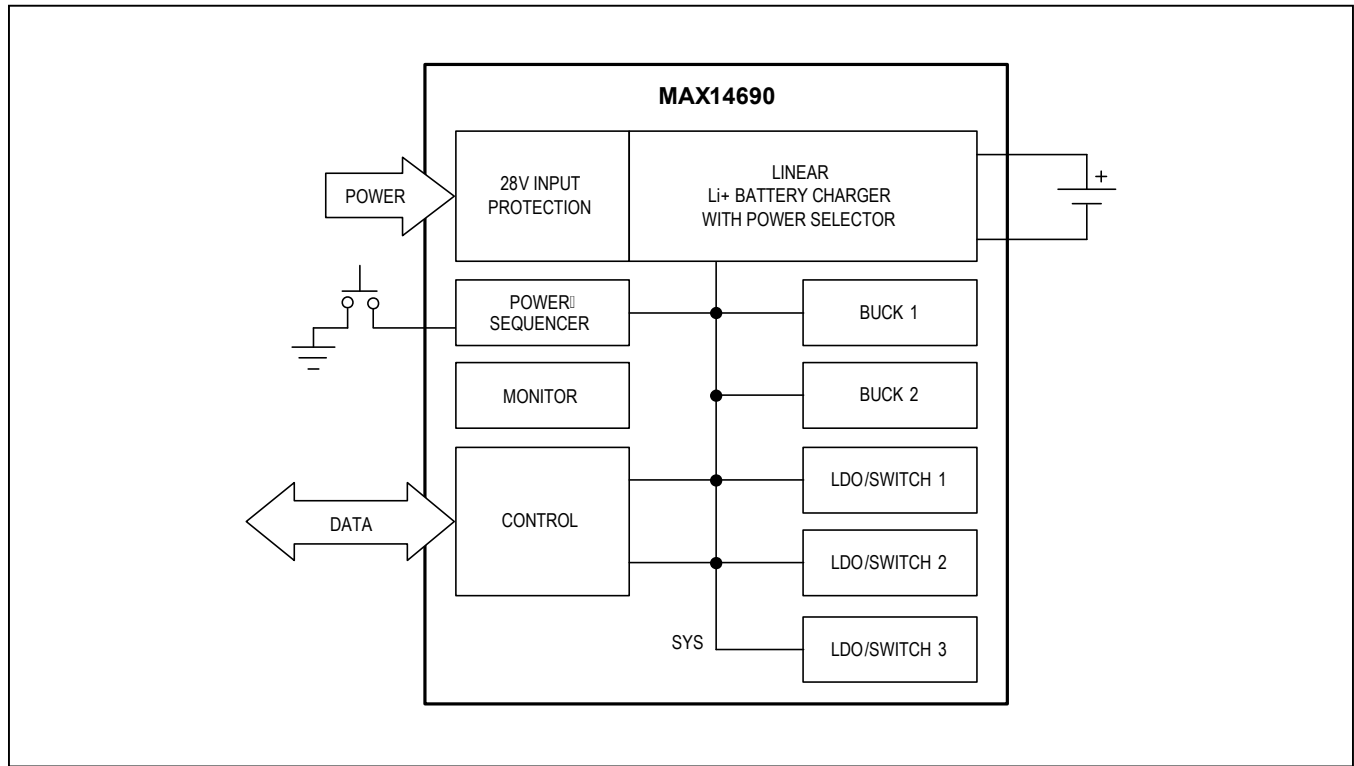

BUMP	NAME	FUNCTION
A1	L1OUT	LDO1 Output. Bypass with a minimum 1µF capacitor to GND.
A2	L1IN	LDO1 Input
A3	CAP	Bypass for Internal LDO. Bypass with a 1µF capacitor to GND.
A4, C3, C4 D3, D4, F4	GND	Ground
A5	B2OUT	1.5V – 3.3V Buck Regulator Output Feedback. Bypass with a minimum 10µF capacitor to GND.
A6	B2LX	1.5V – 3.3V Buck Regulator Switch. Connect 2.2µH inductor to B2OUT.
B1	L2OUT	LDO2 Output. Bypass with a minimum 1µF capacitor to GND.
B2	L2IN	LDO2 Input
B3	INT	Open-Drain, Active-Low Interrupt Output.
B4	MON	Voltage Monitor Pin
B5, B6	BAT	Battery Connection. Connect BAT to a positive battery terminal, bypass BAT with a minimum 1µF capacitor to GND.

## Pin Description (continued)

PIN	NAME	FUNCTION
C1	L3OUT	LDO3 Output. Bypass with a minimum 1 $\mu$ F capacitor to GND.
C2	L3IN	LDO3 Input
C5	SET	External Resistor For Battery Charge Current Level Setting. Do not connect any external capacitance on this pin; maximum allowed capacitance ( $C_{SET} < 5\mu s/R_{SET}$ ) pF.
C6, D6	SYS	System Load Connection. Connect SYS to the system load. Bypass SYS with a minimum 10 $\mu$ F low-ESR ceramic capacitor to GND.
D1	LED	LED Open-Drain Pulldown Current. Add an external current limiting pullup resistor.
D2	PFN2	Power Function Control Input/Output. Programmable functionality via PwrFnMode. See Table 1.
D5	EXT	Push-Pull Gate Drive for Optional External pFET from BAT-to-SYS. Output is pulled to GND when charger is disconnected and internal BAT-SYS FET is switched on. Otherwise, this output is pulled high to the SYS voltage.
E1	$\overline{RST}$	Power-On Reset Output. Active-low, open-drain.
E2	MPC0	Multipurpose Configuration Input 0
E3	MPC1	Multipurpose Configuration Input 1
E4	PFN1	Power Function Control Input. Programmable functionality via PwrFnMode. See Table 1.
E5, E6	CHGIN	+28V Protected Charger Input. Bypass CHGIN with 1 $\mu$ F capacitor to GND.
F1	SDA	Open-Drain, I <sup>2</sup> C Serial Data Input/Output.
F2	SCL	I <sup>2</sup> C Serial Clock Input
F3	THM	Battery Temperature Thermistor Measurement Connection. Connect a 10k $\Omega$ resistor from THM to CAP and a 10k $\Omega$ , 3380A NTC thermistor from THM to GND.
F5	B1OUT	0.8V – 1.8V Buck Regulator Output Feedback. Bypass B1OUT with a minimum 10 $\mu$ F capacitor to GND.
F6	B1LX	0.8V – 1.8V Buck Regulator Switch Terminal. Connect B1LX to B1OUT with a 2.2 $\mu$ H inductor.

**Note:** All capacitance values listed in this document refer to effective capacitance. Be sure to specify capacitors that will meet these requirements under typical system operating conditions taking into consideration the effects of voltage and temperature.

### Block Diagram

### Detailed Description

#### Power Regulation

The MAX14690 family includes two high-efficiency, low quiescent current buck regulators, and three low quiescent current linear regulators that are also configurable as power switches. Excellent light-load efficiency allows the switching regulators to run continuously without significant energy cost. The standard operating mode for the buck regulators is burst mode, but they can be forced to operate in PWM mode through an I<sup>2</sup>C register.

#### Power On/Off and Reset Control

The behavior of power function control pins (PFN1 and PFN2) is preconfigured to support one of the multiple types of wearable application cases. [Table 1](#) describes the behavior of the PFN1 and PFN2 pins based on the PwrRstCfg[3:0] bits and [Figure 1](#) shows basic flow diagrams associated with each mode.

A soft reset will reset all register values and pulls the  $\overline{RST}$  line low. Hard reset initiates a complete Power-On Reset sequence.

Table 1. Power Function Input Control Modes

PwrRstCfg [3:0]	PFN1	PFN1 PU/PD PFNxResEna = 1 (0x1D[7])	PFN2	PFN2 PU/PD PFNxResEna = 1 (0x1D[7])	NOTES
0000	Enable	Pulldown	Active-Low Manual Reset	Pullup*	On/off Mode with 10ms debounce. Active-high on/off control on PFN1. Logic-low on PFN2 generates 10ms pulse on $\overline{RST}$ . Note that, in this mode, the PWR_OFF_CMD in I <sup>2</sup> C has no effect.
0001	Disable	Pullup*	Active-Low Manual Reset	Pullup*	On/off Mode with 10ms debounce. Active-low on/off control on PFN1. Logic-low on PFN2 generates 10ms pulse on $\overline{RST}$ . Note that, in this mode, the PWR_OFF_CMD in I <sup>2</sup> C has no effect.
0010	Hard-Reset on Rising Edge	Pulldown	Soft-Reset on Rising-Edge	Pulldown	Always-On Mode (i.e., device can only be put in off state through PWR_OFF_CMD). 50ms hard-reset off time. 10ms soft-reset pulse time. 200ms delay prior to both reset behaviors.
0011	Hard-Reset on Falling Edge	Pullup*	Soft-Reset Falling-Edge	Pullup*	Always-On Mode (i.e., device can only be put in off state via PWR_OFF_CMD). 50ms hard-reset off time. 10ms soft-reset pulse time. 200ms delay prior to both reset behaviors.
0100	Hard-Reset After CHGIN Attach When High	Pulldown	Soft-Reset After CHGIN Attach When High	Pulldown	Charger Reset High Mode (i.e., device can only be put in off state through PWR_OFF_CMD). 50ms hard-reset off time. 10ms soft-reset pulse time. 200ms delay prior to both reset behaviors.
0101	Hard-Reset After CHGIN Attach When Low	Pullup*	Soft-Reset After CHGIN Attach When Low	Pullup*	Charger Reset Low Mode (i.e., device can only be put in off state through PWR_OFF_CMD). 50ms hard-reset off time. 10ms soft-reset pulse time. 200ms delay prior to both reset behaviors.
0110	$\overline{KIN}$	Pullup*	$\overline{KOUT}$	None	On/Off mode through specific long-press button timing or PWR_OFF_CMD.
0111	$\overline{KIN}$	Pullup*	$\overline{KOUT}$	None	Custom Soft-Reset. Off mode through PWR_OFF_CMD (30ms delay). On mode through specific long-press (3s) or CHGIN insertion. Soft-reset through specific long press (12s).
1000-1111	—	—	—	—	Reserved

\* Pullup is connected to  $V_{CCINT}$ .

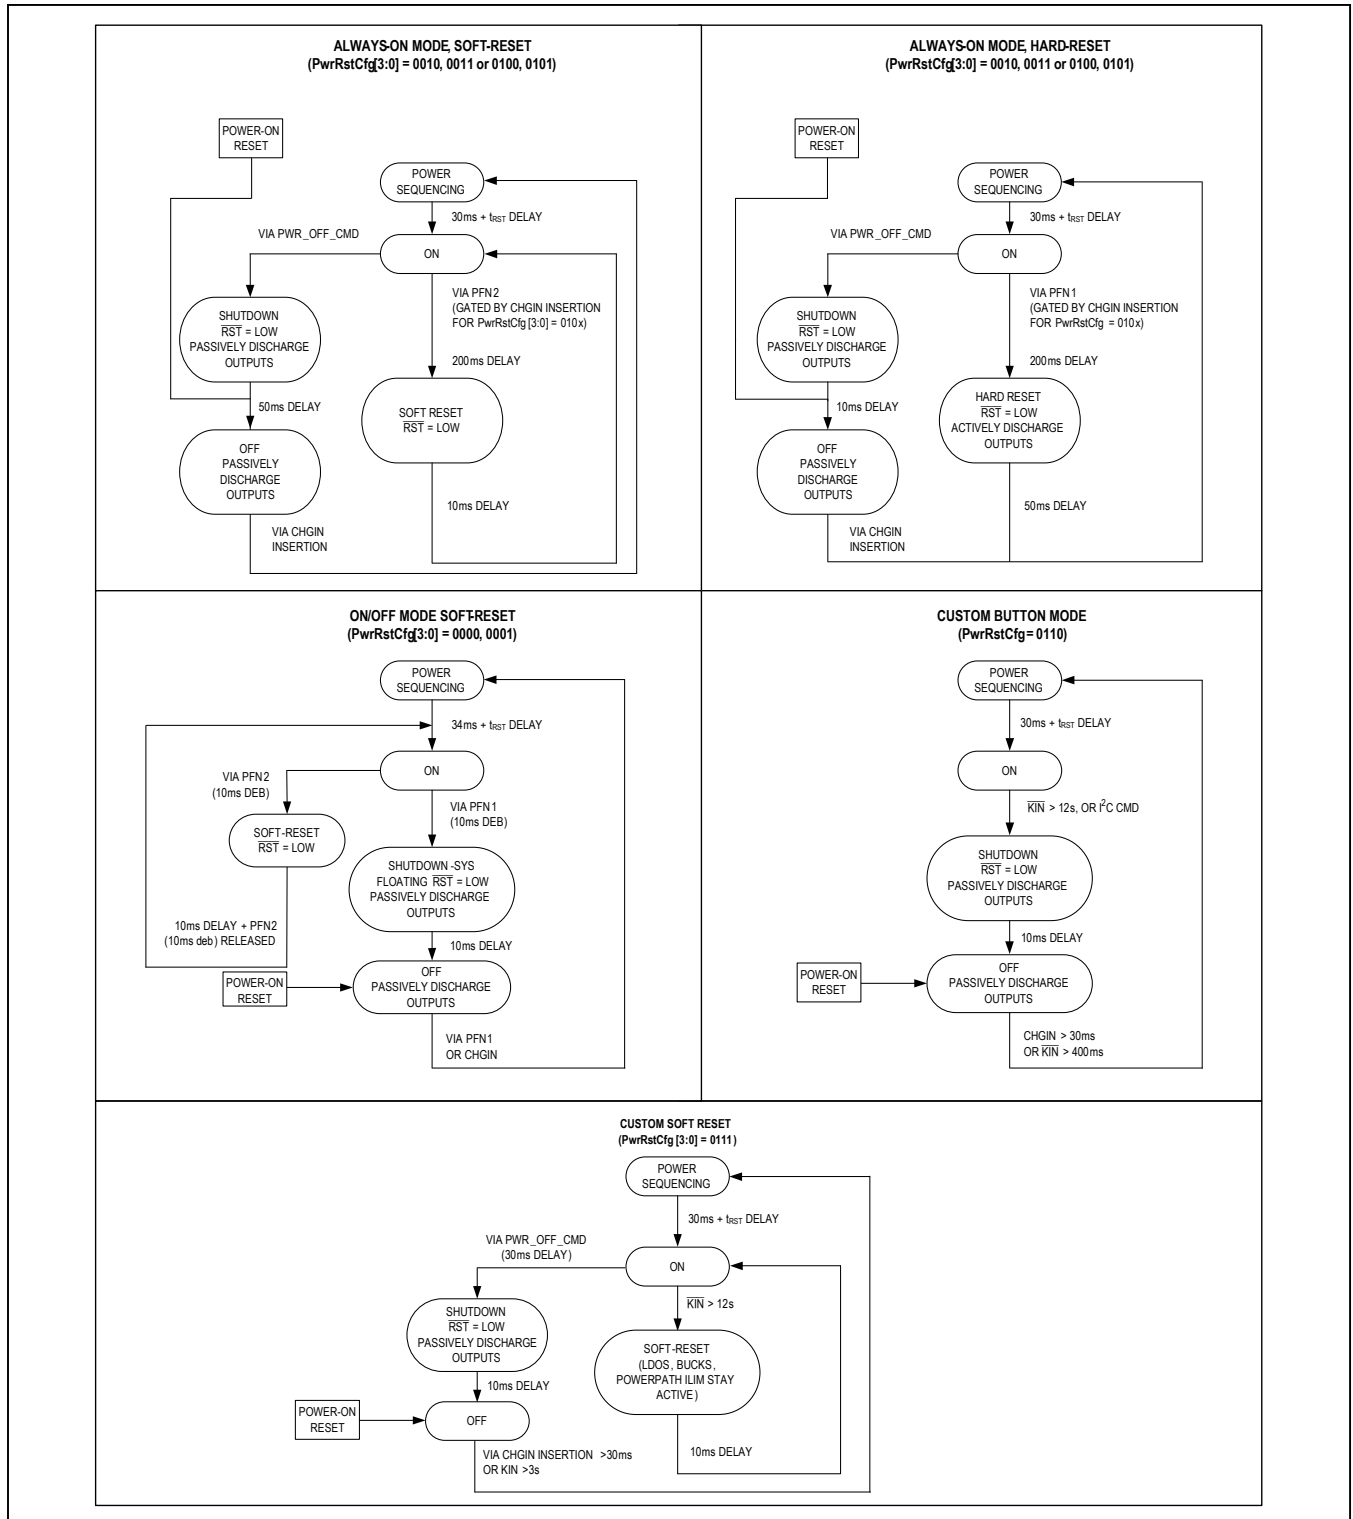

Figure 1. Power Function Input Control Modes Flow Diagrams

**Power Sequencing**

The sequencing of the buck regulators and LDOs during power-on is configurable. See [Table 1](#) for details. Regulators can be configured to turn on at one of three points during the power-on process: 34ms after the power-on event, after the  $\overline{RST}$  signal is released, or at two points in between. The two points between SYS and  $\overline{RST}$  are fixed proportionally to the duration of the Power-On Reset (POR) process, but the overall time of the reset delay is configurable (80ms, 120ms, 220ms, 420ms). The timing relationship is presented graphically in [Figure 2](#).

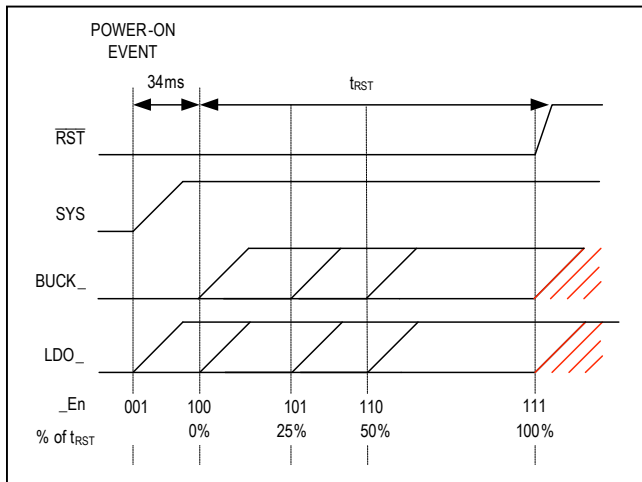

Figure 2. Reset Sequence Programming

Additionally, the regulators can be selected to default off and can be turned on with an I2C command after  $\overline{RST}$  is released. Each LDO regulator can be configured to be always-on as long as SYS or BAT is present.

The SYS voltage is monitored during the power-on sequence. If an undervoltage condition is detected on SYS during the sequencing process with a valid voltage at CHGIN, the process repeats from the point where SYS was enabled to allow more time for the voltage to stabilize. If there is not a valid voltage at CHGIN, the device returns to the off state to avoid draining the battery. Power is also turned off if an undervoltage condition is detected on SYS.

**Smart Power Selector**

The smart power selector seamlessly distributes power from the external CHGIN input to the battery (BAT) and the system (SYS). With both an external adapter and battery connected, the smart power selector basic functions are:

- When the system load requirements are less than the input current limit, the battery is charged with residual power from the input.
- When the system load requirements exceed the input current limit, the battery supplies supplemental current to the load.
- When the battery is connected and there is no external power input, the system is powered from the battery.

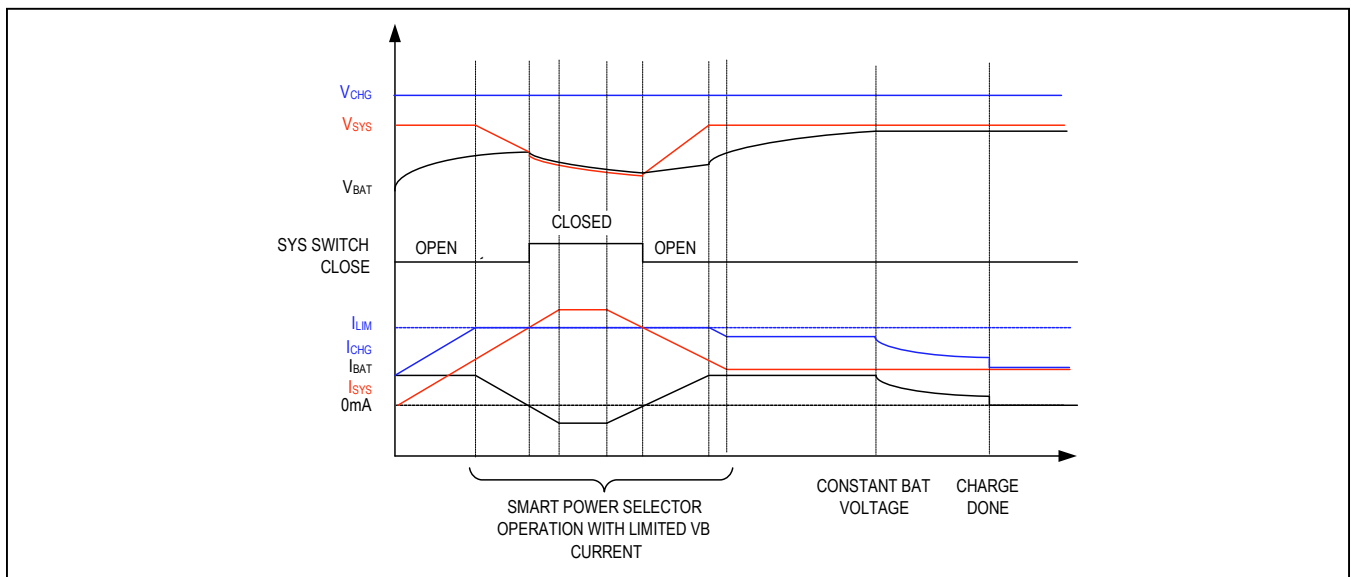

Figure 3. Smart Power Selector Current/Voltage Behavior

### Thermal Current Regulation

In case the die temperature exceeds the normal limit, the MAX14690 will attempt to limit the temperature increase by reducing the input current from CHGIN. In this condition, the system load has priority over charger current, so the input current is first reduced by lowering the charge current. If the junction temperature continues to rise and reaches the maximum operating limit, no input current is drawn from CHGIN and the battery powers the entire system load.

### System Load Switch

An internal 80mΩ (typ) MOSFET connects SYS to BAT when no voltage source is available on CHGIN. When an external source is detected at CHGIN, this switch opens and SYS is powered from the input source through the input current limiter. The SYS-to-BAT switch also prevents  $V_{SYS}$  from falling below  $V_{BAT}$  when the system load exceeds the input current limit. If  $V_{SYS}$  drops to  $V_{BAT}$  due to the current limit, the load switch turns on so the load is supported by the battery. If the system load continuously exceeds the input current limit the battery is not charged. This is useful for handling loads that are nominally below the input current limit but have high current peaks exceeding the input current limit. During these peaks, battery energy is used, but at all other times the battery charges. See [Figure 3](#).

The pin EXT can drive the gate of an external pMOS connected between SYS (source, bulk) and BAT (drain) in parallel to the internal one.

EXT voltage is the buffered version of the internal gate command that controls the internal 80mΩ (typ) MOSFET.

**Note:** The body diode of an external pMOS connected between BAT and SYS remains present when the device is in off mode.

### Input Limiter

The input limiter distributes power from the external adapter to the system load and battery charger. In addition to the input limiter's primary function of passing power to the system load and charger, it performs several additional functions to optimize use of available power:

**Invalid CHGIN Voltage Protection:** If CHGIN is above the overvoltage threshold, the MAX14690 enters overvoltage lockout (OVL). OVL protects the MAX14690

and downstream circuitry from high-voltage stress up to 28V and down to -5.5V. During OVL, the internal circuit remains powered and an interrupt is sent to the host. During OVL, the charger turns off and the system load switch closes, allowing the battery to power SYS. CHGIN is also invalid if it is less than  $V_{BAT}$ , or less than the USB undervoltage threshold. With an invalid input voltage, the SYS-to-BAT load switch closes and allows the battery to power SYS.

**CHGIN Input Current Limit:** The CHGIN input current is limited to prevent input overload. The input current limit is controlled by I<sup>2</sup>C.

**Thermal Limiting:** In case the die temperature exceeds the normal limit ( $T_{CHG\_LIM}$ ), the MAX14690 attempts to limit temperature increase by reducing the input current from CHGIN. In this condition, the system load has priority over the charger current, so the input current is first reduced by lowering the charge current. If the junction temperature continues to rise and reaches the maximum operating limit ( $T_{CHGIN\_SHDN}$ ), no input current is drawn from CHGIN and the battery powers the entire system load.

**Adaptive Battery Charging:** While the system is powered from CHGIN, the charger draws power from SYS to charge the battery. If the total load exceeds the input current limit, an adaptive charger control loop reduces charge current to prevent  $V_{SYS}$  from collapsing.

When the charge current is reduced below 50% due to  $I_{LIM}$  or  $T_{DIE}$ , the timer clock operates at half speed. When the charge current is reduced below 20% due to  $I_{LIM}$  or  $T_{DIE}$ , the timer clock is paused.

### Fast-Charge Current Setting

The MAX14690 uses an external resistor connected from SET to GND to set the fast-charge current. The pre-charge and charge-termination currents are programmed as a percentage of this value via I<sup>2</sup>C registers. The fast-charge current resistor can be calculated as:

$$R_{SET} = K_{SET} \times V_{SET} / I_{FChg}$$

where  $K_{SET}$  has a typical value of 2000A/A and  $V_{SET}$  has a typical value of 1V. The range of acceptable resistors for  $R_{SET}$  is 4kΩ to 400kΩ.

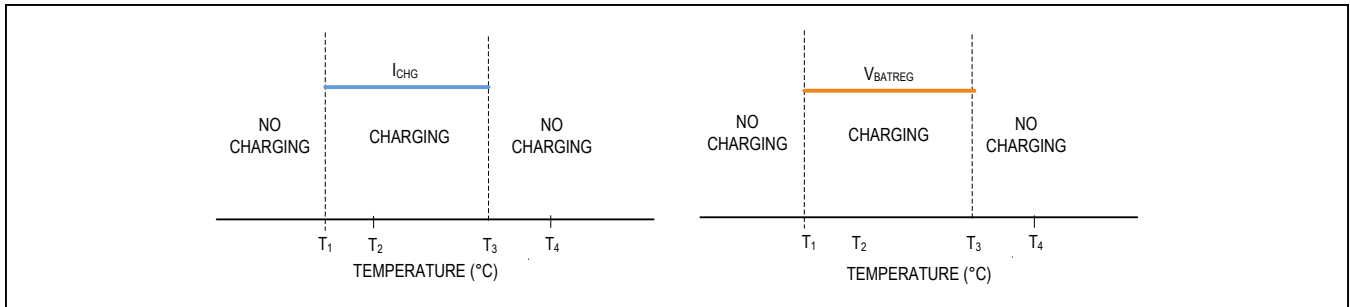

Figure 4a. Charging Behavior Using Thermistor Monitor

Figure 4b. Charging Behavior Using JEITA Monitor

**Table 2. Thermistor Monitoring/JEITA Monitoring Enable Control**

ThermEn	JEITAEn	FUNCTION
0	—	Thermistor/JEITA Monitoring Off
1	0	Thermistor Monitoring On
1	1	JEITA Monitoring On

**Thermistor/JEITA Monitoring with Charger Shutdown**

The MAX14690 includes thermistor and JEITA monitoring to enhance safety when charging Li+ batteries. The battery pack temperature is measured from a divider formed by a pullup resistor connected to CAP and the battery-pack thermistor. The THM pin measures the voltage across the resistor divider and converts it to temperature. There are five temperature zones that can be read from the ThermStat bits in I<sup>2</sup>C. When thermistor monitoring is enabled, the charger is disabled for temperatures below T1 or above T3, as shown in Figure 4a. When JEITA monitoring is enabled, the charger will be disabled for temperatures below T1 or above T4, as shown in Figure 4b. See Table 2 and Table 3 on configuring the thermistor/JEITA monitoring.

**Table 3. Voltage and Example Temperature Thresholds**

	%CAP Thresholds on THM	Temperature Thresholds R <sub>PU</sub> = 10k, R <sub>THM</sub> = 10k (β = 3380)
T1	73.9	0°C
T2	64.5	10°C
T3	32.9	45°C
T4	23.3	60°C

**I<sup>2</sup>C Interface**

The MAX14690 uses the two-wire I<sup>2</sup>C interface to communicate with the host microcontroller. The configuration settings and status information provided through this interface are detailed in the register descriptions.

**I<sup>2</sup>C Addresses**

The registers of the MAX14690 are accessed through the slave address of 0101000 (0x50 for writes/0x51 for reads).

Thermistor Monitoring with Charger Shutdown

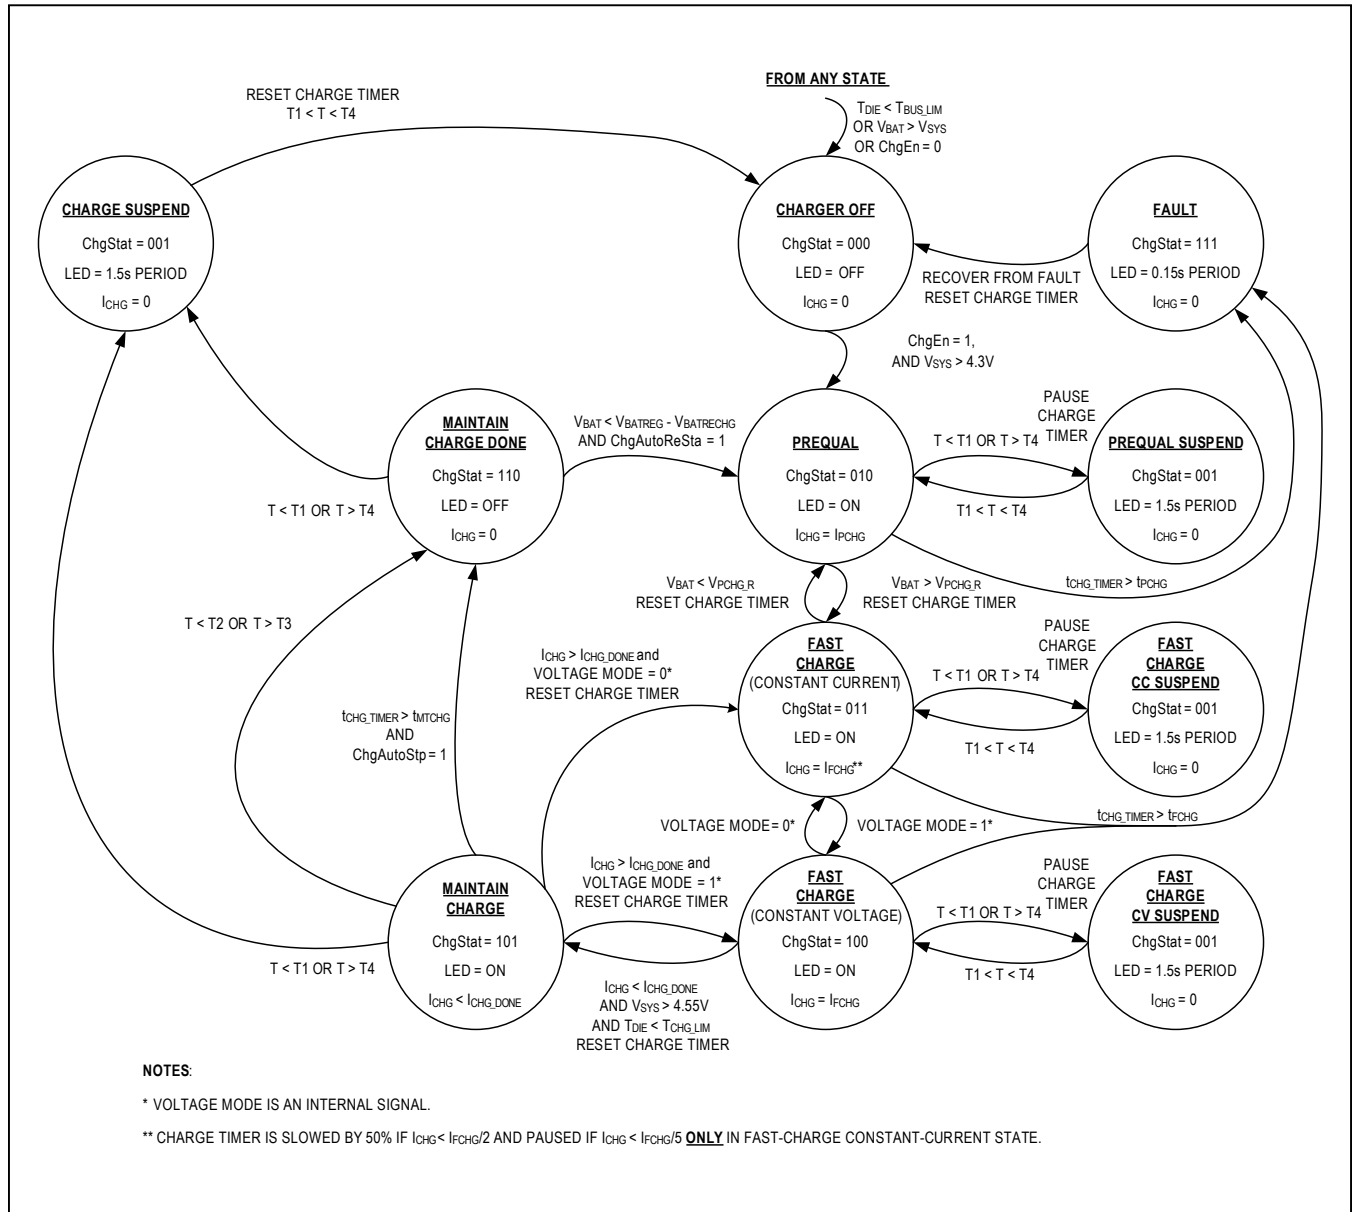

Figure 5. Battery Charger State Diagram

## Applications Information

### I<sup>2</sup>C Interface

The MAX14690\_ contain an I<sup>2</sup>C-compatible interface for data communication with a host controller (SCL and SDA). The interface supports a clock frequency of up to 400kHz. SCL and SDA require pullup resistors that are connected to a positive supply.

### Start, Stop, And Repeated Start Conditions

When writing to the MAX14690\_ using I<sup>2</sup>C, the master sends a START condition (S) followed by the MAX14690\_ I<sup>2</sup>C address. After the address, the master sends the register address of the register that is to be programmed. The master then ends communication by issuing a STOP condition (P) to relinquish control of the bus, or a REPEATED START condition (Sr) to communicate to another I<sup>2</sup>C slave. See Figure 6.

Table 4. I<sup>2</sup>C Slave Addresses

ADDRESS FORMAT	HEX	BINARY
7-Bit Slave ID	0x28	0101000
Write Address	0x50	01010000
Read Address	0x51	01010001

Figure 6. I<sup>2</sup>C START, STOP and REPEATED START Conditions

### Slave Address

Set the Read/Write bit high to configure the MAX14690\_ to read mode (Table 4). Set the Read/Write bit low to configure the MAX14690\_ to write mode. The address is the first byte of information sent to the MAX14690\_ after the START condition.

### Bit Transfer

One data bit is transferred on the rising edge of each SCL clock cycle. The data on SDA must remain stable during the high period of the SCL clock pulse. Changes in SDA while SCL is high and stable are considered control signals (see the Start, Stop, And Repeated Start Conditions section). Both SDA and SCL remain high when the bus is not active.

### Single-Byte Write

In this operation, the master sends an address and two data bytes to the slave device (Figure 7). The following procedure describes the single byte write operation:

- 1) The master sends a START condition
- 2) The master sends the 7-bit slave address plus a write bit (low)
- 3) The addressed slave asserts an ACK on the data line
- 4) The master sends the 8-bit register address
- 5) The slave asserts an ACK on the data line only if the address is valid (NAK if not)
- 6) The master sends 8 data bits
- 7) The slave asserts an ACK on the data line
- 8) The master generates a STOP condition

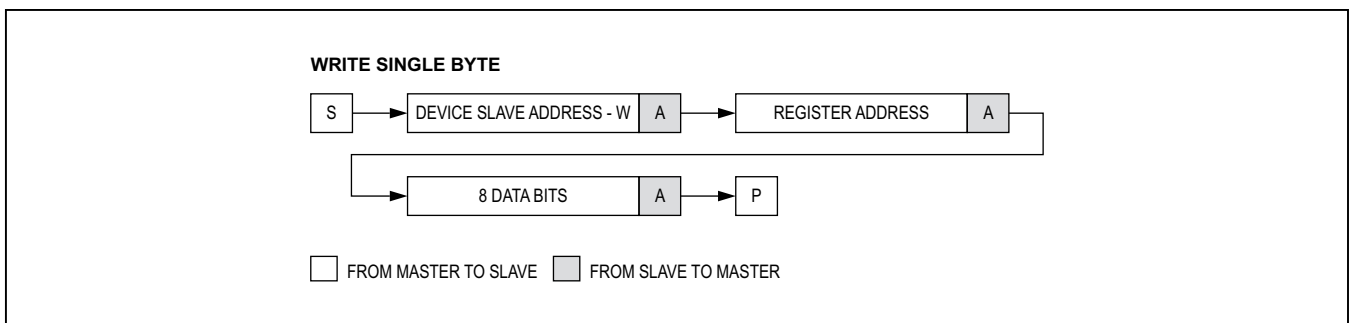

Figure 7. Write Byte Sequence

**Burst Write**

In this operation, the master sends an address and multiple data bytes to the slave device (Figure 8). The slave device automatically increments the register address after each data byte is sent, unless the register being accessed is 0x00, in which case the register address remains the same. The following procedure describes the burst write operation:

- 1) The master sends a START condition
- 2) The master sends the 7-bit slave address plus a write bit (low)
- 3) The addressed slave asserts an ACK on the data line
- 4) The master sends the 8-bit register address
- 5) The slave asserts an ACK on the data line only if the address is valid (NAK if not)
- 6) The master sends eight data bits
- 7) The slave asserts an ACK on the data line
- 8) Repeat 6 and 7 N-1 times
- 9) The master generates a STOP condition

**Single Byte Read**

In this operation, the master sends an address plus two data bytes and receives one data byte from the slave device (Figure 9). The following procedure describes the single byte read operation:

- 1) The master sends a START condition
- 2) The master sends the 7-bit slave address plus a write bit (low)
- 3) The addressed slave asserts an ACK on the data line
- 4) The master sends the 8-bit register address
- 5) The slave asserts an ACK on the data line only if the address is valid (NAK if not)
- 6) The master sends a REPEATED START condition
- 7) The master sends the 7-bit slave address plus a read bit (high)
- 8) The addressed slave asserts an ACK on the data line
- 9) The slave sends eight data bits
- 10) The master asserts a NACK on the data line
- 11) The master generates a STOP condition

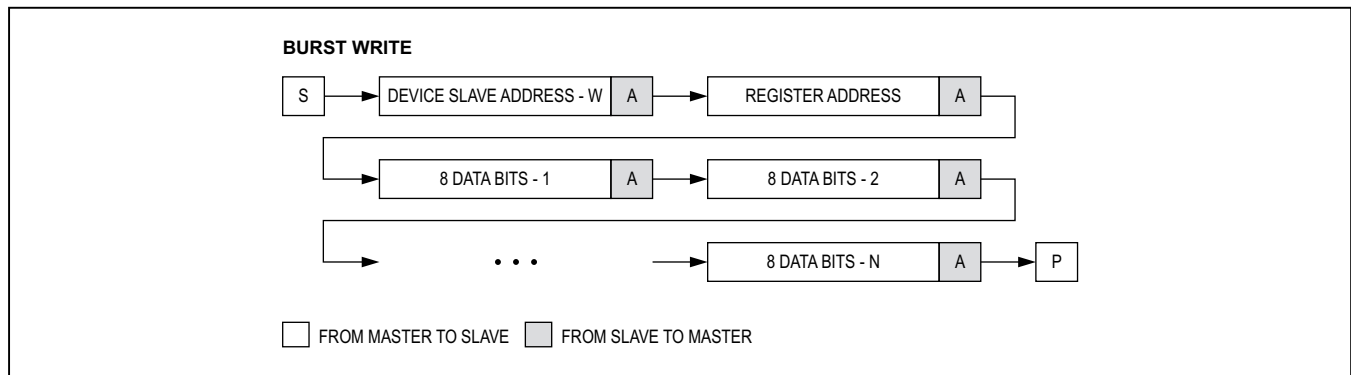

Figure 8. Burst Write Sequence

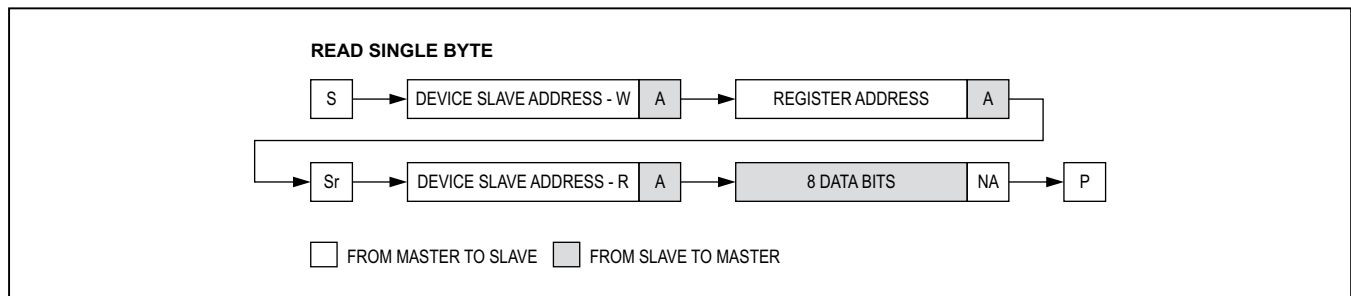

Figure 9. Read Byte Sequence

**Burst Read**

In this operation, the master sends an address plus two data bytes and receives multiple data bytes from the slave device (Figure 210). The following procedure describes the burst byte read operation:

- 1)The master sends a START condition
- 2)The master sends the 7-bit slave address plus a write bit (low)
- 3)The addressed slave asserts an ACK on the data line
- 4)The master sends the 8-bit register address
- 5)The slave asserts an ACK on the data line only if the address is valid (NAK if not)
- 6)The master sends a REPEATED START condition
- 7)The master sends the 7-bit slave address plus a read bit (high)
- 8)The slave asserts an ACK on the data line

- 9)The slave sends eight data bits
- 10) The master asserts an ACK on the data line
- 11) Repeat 9 and 10 N-2 times
- 12) The slave sends the last eight data bits
- 13) The master asserts a NACK on the data line
- 14) The master generates a STOP condition

**Acknowledge Bits**

Data transfers are acknowledged with an acknowledge bit (ACK) or a not-acknowledge bit (NACK). Both the master and the MAX14690\_ generate ACK bits. To generate an ACK, pull SDA low before the rising edge of the ninth clock pulse and hold it low during the high period of the ninth clock pulse (see Figure 3a11). To generate a NACK, leave SDA high before the rising edge of the ninth clock pulse and leave it high for the duration of the ninth clock pulse. Monitoring for NACK bits allows for detection of unsuccessful data transfers.

**Note:** COR = Clear-on-read

\*Register is reset to default value upon CHGIN rising edge.

\*\* R if WriteProtect enabled (Table 35).

All R/W registers are reset to default value when entering the off state.

Reserved bits must not be modified from their default states to ensure proper operation.

## I<sup>2</sup>C Register Descriptions

**Table 5. ChipId Register (0x00)**

<b>ADDRESS:</b>	0x00							
<b>MODE:</b>	Read-Only							
<b>BIT</b>	7	6	5	4	3	2	1	0
<b>NAME</b>	Chip_Id[7:0]							
<b>Chip_Id[7:0]</b>	Chip_Id[7:0] bits show information about the version of the MAX14690.							

**Table 6. ChipRev Register (0x01)**

<b>ADDRESS:</b>	0x01							
<b>MODE:</b>	Read-Only							
<b>BIT</b>	7	6	5	4	3	2	1	0
<b>NAME</b>	Chip_Rev[7:0]							
<b>Chip_Rev[7:0]</b>	Chip_Rev[7:0] bits show information about the revision of the MAX14690 silicon.							

**Table 7. StatusA Register (0x02)**

<b>ADDRESS:</b>	0x02							
<b>MODE:</b>	Read-Only							
<b>BIT</b>	7	6	5	4	3	2	1	0
<b>NAME</b>	–	–	ThermStat[2:0]			ChgStat[2:0]		
<b>ThermStat[2:0]</b>	<p>Status of Thermistor Monitoring</p> <p>000 = T &lt; T1</p> <p>001 = T1 &lt; T &lt; T2</p> <p>010 = T2 &lt; T &lt; T3</p> <p>011 = T3 &lt; T &lt; T4</p> <p>100 = T &gt; T4</p> <p>101 = No thermistor detected (THM high due to external pullup). Note that if a parallel resistor is used for thermistor monitoring, this mode may not function properly.</p> <p>110 = NTC input disabled through ThermEn</p> <p>111 = Detection disabled due to CHGIN not present.</p>							
<b>ChgStat[2:0]</b>	<p>Status of Charger Mode</p> <p>000 = Charger off</p> <p>001 = Charging suspended due to temperature (see <a href="#">Figure 5</a>)</p> <p>010 = Pre-charge in progress</p> <p>011 = Fast-charge, constant current mode in progress</p> <p>100 = Fast-charge, constant voltage mode in progress</p> <p>101 = Maintain charge in progress</p> <p>110 = Maintain charger timer done</p> <p>111 = Charger fault condition (see <a href="#">Figure 5</a>)</p>							

**Table 8. StatusB Register (0x03)**

ADDRESS:	0x03							
MODE:	Read-Only							
BIT	7	6	5	4	3	2	1	0
NAME	—	—	ILim	UsbOVP	UsbOk	Chg ThrmSd	Chg ThrmReg	ChgTmo
<b>ILim</b>	CHGIN Input Current Limit 0 = CHGIN input current is within limit. 1 = CHGIN input is in current limit.							
<b>UsbOVP</b>	Status of CHGIN OVP 0 = CHGIN OVP is not active. 1 = CHGIN OVP is active.							
<b>UsbOk</b>	Status of CHGIN Input 0 = CHGIN Input is not present or outside of valid range. 1 = CHGIN Input is present and valid.							
<b>ChgThrmSd</b>	Status of Thermal Shutdown 0 = Charger and input current limiter is in normal operating mode. 1 = Charger and input current limiter is in thermal shutdown.							
<b>ChgThrmReg</b>	Status of Thermal Regulation 0 = Charger is functioning normally, or disabled. 1 = Charger is running in thermal regulation mode and charging current is being actively reduced to prevent device overheating.							
<b>ChgTmo</b>	Status of Time-Out Condition 0 = Charger is running normally, or disabled. 1 = Charger has reached a time-out condition. ChgStat =1 11 in this condition (see Figure 5).							

**Table 9. StatusC Register (0x04)**

ADDRESS:	0x04							
MODE:	Read-Only							
BIT	7	6	5	4	3	2	1	0
NAME	—	—	—	ThrmBuck1	ThrmBuck2	ThrmLDO1	ThrmLDO2	ThrmLDO3
<b>ThrmBuck1</b>	0 = Buck1 NOT in Thermal Off mode 1 = Buck1 in Thermal Off Mode							
<b>ThrmBuck2</b>	0 = Buck2 NOT in Thermal Off mode 1 = Buck2 in Thermal Off Mode							
<b>ThrmLDO1</b>	0 = LDO1 NOT in Thermal Off mode 1 = LDO1 in Thermal Off Mode							
<b>ThrmLDO2</b>	0 = LDO2 NOT in Thermal Off mode 1 = LDO2 in Thermal Off Mode							
<b>ThrmLDO3</b>	0 = LDO3 NOT in Thermal Off mode 1 = LDO3 in Thermal Off Mode							

**Table 10. IntA Register (0x05)**

<b>ADDRESS:</b>	<b>0x05</b>							
<b>MODE:</b>	<b>Clear On Read</b>							
<b>BIT</b>	<b>7</b>	<b>6</b>	<b>5</b>	<b>4</b>	<b>3</b>	<b>2</b>	<b>1</b>	<b>0</b>
<b>NAME</b>	Therm StatInt	ChgStatInt	ILimInt	UsbOVPInt	UsbOk	Chg ThrmSdInt	Therm RegInt	Chg Tmolnt
<b>ThermStatInt</b>	Change in ThermStat caused interrupt.							
<b>ChgStatInt</b>	Change in ChgStat caused interrupt, or first detection complete after POR.							
<b>ILimInt</b>	Input current limit triggered caused interrupt.							
<b>UsbOVPInt</b>	Change in UsbOVP caused interrupt.							
<b>UsbOk</b>	Change in UsbOk caused interrupt.							
<b>ChgThrmSdInt</b>	Change in ChgThrmSd caused interrupt.							
<b>ThermRegInt</b>	Change in ChgThrmReg caused interrupt.							
<b>ChgTmolnt</b>	Change in ChgTmo caused interrupt.							
<b>ThermStatInt</b>	Change in ThermStat caused interrupt.							

**Table 11. IntB Register (0x06)**

<b>ADDRESS:</b>	<b>0x06</b>							
<b>MODE:</b>	<b>Clear On Read</b>							
<b>BIT</b>	<b>7</b>	<b>6</b>	<b>5</b>	<b>4</b>	<b>3</b>	<b>2</b>	<b>1</b>	<b>0</b>
<b>NAME</b>	—	—	—	Thrm Buck1Int	Thrm Buck2Int	Thrm LDO1Int	Thrm LDO2Int	Thrm LDO3Int
<b>ThrmBuck1Int</b>	Change in ThrmBuck1 caused interrupt.							
<b>ThrmBuck2Int</b>	Change in ThrmBuck2 caused interrupt.							
<b>ThrmLDO1Int</b>	Change in ThrmLDO1 caused interrupt.							
<b>ThrmLDO2Int</b>	Change in ThrmLDO2 caused interrupt.							
<b>ThrmLDO3Int</b>	Change in ThrmLDO3 caused interrupt.							

**Table 12. IntMaskA Register (0x07)**

<b>ADDRESS:</b>	<b>0x07</b>							
<b>MODE:</b>	<b>Read/Write</b>							
<b>BIT</b>	<b>7</b>	<b>6</b>	<b>5</b>	<b>4</b>	<b>3</b>	<b>2</b>	<b>1</b>	<b>0</b>
<b>NAME</b>	Therm StatIntM	Chg StatIntM	ILimIntM	Usb OVPIntM	UsbOkM	ChgThrm SdIntM	Therm RegIntM	Chg TmolntM
<b>ThermStatIntM</b>	ThermStatIntM masks the ThermStatInt interrupt in the IntA register (0x05). 0 = Mask 1 = Not masked							
<b>ChgStatIntM</b>	ChgStatIntM masks the ChgStatInt interrupt in the IntA register (0x05). 0 = Mask 1 = Not masked							
<b>ILimIntM</b>	ILimIntM masks the ILimInt interrupt in the IntB register (0x06). 0 = Mask 1 = Not masked							
<b>UsbOVPIntM</b>	UsbOVPIntM masks the UsbOVPInt interrupt in the IntA register (0x05). 0 = Mask 1 = Not masked							
<b>UsbOkM</b>	UsbOkM masks the UsbOk interrupt in the IntB register (0x06). 0 = Mask 1 = Not masked							
<b>ChgThrm SdIntM</b>	ChgThrmSdIntM masks the ChgThrmSdInt interrupt in the IntB register (0x06). 0 = Mask 1 = Not masked							
<b>ThermRegIntM</b>	ThermRegIntM masks the ThermRegInt interrupt in the IntA register (0x05). 0 = Mask 1 = Not masked							
<b>ChgTmolntM</b>	ChgTmolntM masks the ChgTmolnt interrupt in the IntA register (0x05). 0 = Mask 1 = Not masked							

**Table 13. IntMaskB Register (0x08)**

<b>ADDRESS:</b>	0x08							
<b>MODE:</b>	Read/Write							
<b>BIT</b>	<b>7</b>	<b>6</b>	<b>5</b>	<b>4</b>	<b>3</b>	<b>2</b>	<b>1</b>	<b>0</b>

<b>ThrmBuck1 IntM</b>	0 = Mask 1 = Not masked							
<b>ThrmBuck2 IntM</b>	0 = Mask 1 = Not masked							
<b>ThrmLDO1 IntM</b>	0 = Mask 1 = Not masked							
<b>ThrmLDO2 IntM</b>	0 = Mask 1 = Not masked							
<b>ThrmLDO3 IntM</b>	0 = Mask 1 = Not masked							

**Table 14. ILimCntl Register (0x09)**

<b>ADDRESS:</b>	0x09							
<b>MODE:</b>	Read/Write* or Read-Only if WriteProtect Enabled (see <a href="#">Table 36</a> )							
<b>BIT</b>	<b>7</b>	<b>6</b>	<b>5</b>	<b>4</b>	<b>3</b>	<b>2</b>	<b>1</b>	<b>0</b>
<b>NAME</b>	—	—	—	—	—	—	ILimCntl [1:0]	
<b>ILimCntl[1:0]</b>	CHGIN Custom Input Current Limit (see <a href="#">Electrical Characteristics</a> for details) 00 = 0mA 01 = 100mA 10 = 500mA 11 = 1000mA							

\*Register is reset to default value upon CHGIN rising edge.

Table 15. ChgCntlA Register (0x0A)

ADDRESS:	0x0A							
MODE:	Read/Write* or Ready-Only if WriteProtect Enabled (see Table 36)							
BIT	7	6	5	4	3	2	1	0
NAME	ChgAuto Stp	ChgAuto ReSta	BatReChg[1:0]		BatReg[2:0]			ChgEn
<b>ChgAutoStp</b>	Charger Auto-Stop. Controls the transition from Maintain Charger to Maintain Charger Done. 0 = Autostop disabled. 1 = Autostop enabled.							
<b>ChgAutoReSta</b>	Charger Auto Restart Control 0 = Charger remains in maintain charge done even when $V_{BAT}$ is less than charge restart threshold (see Charger state diagram). 1 = Charger automatically restarts when $V_{BAT}$ drops below charge restart threshold.							
<b>BatReChg[1:0]</b>	Recharge Threshold in Relation to BatReg 00 = BatReg - 70mV 01 = BatReg - 120mV 10 = BatReg - 170mV 11 = BatReg - 220mV							
<b>BatReg[2:0]</b>	Setting the Battery Regulation Threshold 000 = 4.05V 001 = 4.10V 010 = 4.15V 011 = 4.20V 100 = 4.25V 101 = 4.30V 110 = 4.35V 111 = Reserved							
<b>ChgEn</b>	On/Off Control for Charger (does not affect SYS node). 0 = Charger disabled. 1 = Charger enabled.							

\*Register is reset to default value upon CHGIN rising edge.

Table 16. ChgCntlB Register (0x0B)

ADDRESS:	0x0B							
MODE:	Read/Write* or Ready-Only if WriteProtect Enabled (see Table 35)							
BIT	7	6	5	4	3	2	1	0
NAME	—		VPChg[2:0]		IPChg[1:0]		ChgDone[1:0]	
<b>VPChg[2:0]</b>	Precharge voltage threshold setting 000 = 2.10V 001 = 2.25V 010 = 2.40V 011 = 2.55V 100 = 2.70V 101 = 2.85V 110 = 3.00V 111 = 3.15V							
<b>IPChg[1:0]</b>	Precharge current setting 00 = 0.05 x I <sub>FCHG</sub> 01 = 0.1 x I <sub>FCHG</sub> 10 = 0.2 x I <sub>FCHG</sub> 11 = 0.3 x I <sub>FCHG</sub>							
<b>ChgDone[1:0]</b>	Charge done threshold setting 00 = 0.05 x I <sub>FCHG</sub> 01 = 0.1 x I <sub>FCHG</sub> 10 = 0.2 x I <sub>FCHG</sub> 11 = 0.3 x I <sub>FCHG</sub>							

\*Register is reset to default value upon CHGIN rising edge.

Table 17. ChTmr Register (0x0C)

ADDRESS:	0x0C							
MODE:	Read/Write* or Ready-Only if WriteProtect Enabled (see Table 35)							
BIT	7	6	5	4	3	2	1	0
NAME	—		MtChgTmr[1:0]		FChgTmr[1:0]		PChgTmr[1:0]	
<b>MtChgTmr [1:0]</b>	Maintain Charge Timer Setting 00 = 0min 01 = 15min 10 = 30min 11 = 60min							
<b>FChgTmr[1:0]</b>	Fast-Charge Timer Setting 00 = 75min 01 = 150min 10 = 300min 11 = 600min							
<b>PChgTmr[1:0]</b>	Precharge Timer Setting 00 = 30min 01 = 60min 10 = 120min 11 = 240min							

\*Register is reset to default value upon CHGIN rising edge.

**Table 18. Buck1Cfg Register (0x0D)**

<b>NAME</b>	PFNx ResEna	–	–	–	–	–	–	StayOn
<b>PFNxResEna</b>	PFN_ Automatic Internal Pull-Up/Pull-Down Enable 0 = No internal pullup/pulldown 1 = Automatic internal pullup/pulldown as per Table 1							
<b>StayOn</b>	This bit is used to ensure that the processor booted correctly. This bit must be set within 5s of power-on to prevent the part from shutting down and returning to the power-off condition. This bit has no effect after being set. 0 = Shut down 5s after power-on 1 = Stay on							

**Table 34. PwrOff Register (0x1F)**

<b>ADDRESS:</b>	0x1F							
<b>MODE:</b>	Read/Write							
<b>BIT</b>	<b>7</b>	<b>6</b>	<b>5</b>	<b>4</b>	<b>3</b>	<b>2</b>	<b>1</b>	<b>0</b>
<b>NAME</b>	PWR_CMD[7:0]							
<b>PWR_CMD [7:0]</b>	Power-Off Command Writing 0xB2 to this register places the part in the off mode except in PwrRstCfg[3:0] modes 0000 and 0001 when it has no effect. Writing any other code has no effect. In PwrRstCfg[3:0] modes 0110 and 0111, the part can be turned back on by a button press or a valid voltage applied to CHGIN. In all other modes, only a valid voltage applied to CHGIN turns the device back on. See <a href="#">Figure 1</a> for more details.

+Denotes a lead(Pb)-free package/RoHS-compliant package.

T = Tape and reel.

\*Future Product—contact marketing for availability.

See [Table 35](#) and [Table 36](#) for the device differences.

## Chip Information

PROCESS: BiCMOS

## Package Information

For the latest package outline information and land patterns (footprints), go to [www.maximintegrated.com/packages](http://www.maximintegrated.com/packages). Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

PACKAGE TYPE	PACKAGE CODE	OUTLINE NO.	LAND PATTERN NO.
36 WLP	W362D2+1	<a href="#">21-0897</a>	Refer to <a href="#">Application Note 1891</a>

## Revision History

REVISION NUMBER	REVISION DATE	DESCRIPTION	PAGES CHANGED
0	12/14	Initial release	—
1	4/15	BUCK1 default was changed to 1.175V from 2.0V	6, 13, 15, 16, 19, 22, 40
2	4/15	Removed future product designation from MAX14690AEWX+	41
3	4/15	Added additional Buck Ripple specifications in <i>Electrical Characteristics</i> table	5, 6
4	5/15	Added I <sup>2</sup> C section and MAX14690C/D/N as future products	2, 11, 17-18, 22, 24, 39-42
5	7/15	Removed future product designation from MAX14690DEWX+ and MAX14690DEWX+T	45
6	10/15	Removed future product designation of MAX14690C and MAX14690N	2, 10, 13, 18, 29, 41-45
7	1/16	Added MAX14690I part numbers to data sheet	5, 11, 18, 43–45
8	2/16	Push Button Control diagram updated	18
9	2/16	Removed future product designation from MAX14690I	45
10	4/16	Removed future product designation from MAX14690H and added MAX14690J to <i>Ordering Information</i> table	43-45
11	5/16	Added MAX14690K future product	43-45

For pricing, delivery, and ordering information, please contact Maxim Direct at 1-888-629-4642, or visit Maxim Integrated's website at [www.maximintegrated.com](http://www.maximintegrated.com).

Maxim Integrated cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim Integrated product. No circuit patent licenses are implied. Maxim Integrated reserves the right to change the circuitry and specifications without notice at any time. The parametric values (min and max limits) shown in the *Electrical Characteristics* table are guaranteed. Other parametric values quoted in this data sheet are provided for guidance.
